Abstract

From an economic and environmental point of view, investments in a high-performance waste management system are of major importance at the level of the entire county. The main purpose of this study is to identify the impact of this system on both the environment and the population, but also the impact of this system on the economy of the county. According to this study, we have found that since the entire waste management system will be implemented, the impact felt by the population of Tecuci will be less and less, and from an economic point of view, there will be a decrease of the tax sanitation.

Keywords: education, selective waste collection, smart recycling, waste management system
